cat file format? is there any other way that we can save our designs in .cat format to be used by catia software? A: CATIA can be written to a .CAT file format, but is designed to be read from and written to by the CATIA CAD system. A typical .MAT file is very large, with a header and many many lines of design data. The designer/engineer must decide how much data to put into the file and how to encapsulate that data. For example, a small 3D solid might only need a few lines of data; a large complex component may need multiple lines of data. In comparison, the .CAT file is typically smaller than a .MAT file. However, the .CAT file is structured into sections, each section typically contains all of the information about a single component (there are exceptions, such as background and general information, but these are in addition to the structure and content of the .CAT file). The designer can save the design in the .CAT file format, but the saved design will be read into CATIA as a .MAT file and can be edited with CATIA CAD. There is no other way to read the .CAT file format in CATIA. Q: Issue with Picking up a dynamically created d3.js Tree I'm trying to make a d3.js Tree with dynamic data input from an API. The data that gets put into the tree is HTML which gets rendered in a Bootstrap Modal. This part works well, but when I try and create the tree (it's using a dynamic JSON data source) the 'on click' event is not firing. The structure of the tree is like so:
